## REMARKS

Claims 26, 27, 28, 29, 30, 31, 32, 35, 41, 43, 45, and 48-51 are in this application. Claims 33, 34, 36-40, 32 44 and 46 have been cancelled.

Claims 26 has been amended and claims 50 and 51 have been added. Support for the amendments to claim 26 and the addition of claims 50 and 51 is supported on, *inter alia*, pages 5-10 of the specification.

The Examiner has rejected claims 26-32, 35, 41, 43, 45, and 47-49 under 35 USC 112, first paragraph. This is respectfully traversed.

In view of the amendment of Claim 26 and the addition of claims 50 and 51 it is respectfully requested that this rejection be withdrawn. The amendments to Claim 26 provide antecendent basis for "the section length" in claims 48 and 49.

The Examiner has rejected Claim 35 under 35 USC 112, first paragraph as failing to comply with the enablement requirement. This is respectfully traversed.

According to the article from About.com Local foods there are about 600 varieties of strawberries. A number of strawberry varieties are shown in the printout from Unibase.ca and the ones that are included in claim 35 are indicated by an arrow. These are attached. Based on this it is clear that claim 35 is enabled.

Therefore, it is respectfully requested that this rejection be withdrawn.

Claims 26-32, 35, 41, 43, 45, and 47-49 are rejected under 35 USC 103(a) as being unpatentable over Mathews et al. in view of Dogov et al. This is respectfully traversed. The methods disclosed in these references do not make the claimed invention obvious. In the method claimed in this application, the internal induction processes occurring in an explant in response to a wound caused by separating an explant from the leaf disk.

The method claimed makes it possible to enhance the level of induced resistance formed in anvexplant due to the use of time intervals between the first and the second steps of separating thevexplants from each other. During this time interval (1 to 5 days) one side of the explant "is healed" by proteins and enzymes induced not only at the site of wounding. According to the method claimed, the final separation of an explant from a leaf is carried out upon completion of regeneration of the rear side of the explant.

The inventors claim that the final separation of the explant upon a certain time interval makes it possible to use the internal induction processes resulting from the wound shaping and aiming at maintaining stability and lowering necrosis of cells and somatic variations. There are provided examples of genetic engineering constructs that enable one to transform a selected plant in accordance with predetermined tasks.

The experimental data show that the stepwise procedure of preparing explants lowers the level of necrosis in explants and enhances the efficiency of the method (see the Original Description Example I, Fig. 3) As seen from the graph in Fig. 3, the level of necrosis is reduced upon the stepwise and consecutive procedure of separating explants formed in lots Al to A5, wherein each explant is separated from the remaining disk segment after incubation thereof for 1 to 5 days to allow for the transformation of plant cells with agrobacteria at the sites of fresh woundings. It should be noted that the transformation was carried out with a vector construct with no PR protein genes. Hence, the decrease in necrotic phenomena and enhancement of the transformation efficiency are not achieved due to the protective protein genes, e.g., PR protein genes, transferred to explants cells, but result from the

stepwise inoculation of the plant material during the agrobacterial transformation.

This is also evidence that during the stepwise treatment of explants an induced resistance to abiotic and biotic stresses is formed due to the inner protective mechanisms of plant cells. The results obtained show the non-obviousness of the claimed technical solution comprising the stepwise treatment of plant material during agrobacterial transformation and distinguishes the present method from methods of agrobacterial transformation of plants is distinguished and not obvious from the cited art.

Figures 1-3, attached, show photographs of a non-transgenic plant of the Selekta variety (Fig. 1), a transgenic line with a deviation (Fig. 2), and a transgenic line having no deviations (Fig. 3). To produce transgenic lines. having no deviations, it is necessary at the stage of transformation and preparation of explants to reduce the necrosis rate, since necrosis leads to inhibition of plant transformation, and regeneration passes the stage of callus formation. On account of callus formation, regeneration lasts several months and the number of deviations in a transgenic plant increases.

In the claimed method, the degree of necrosis was controlled visually and by means of a CUS expression with staining the explants. For explants lots with reduced necrosis, a higher transient GUS expression (blue colour) is observed (Fig. 4). For lots with reduced necrosis, the proportion of explants, wherein direct regeneration occurs, is higher as compared with lots with increased callus formation. Due to direct regeneration, properties of a genotype remain unchanged and the frequency of somaclonal deviations decreases. The invention permits lowering a proportion of plants with somaclonal deviations to 30%, which is half as that upon using standard methods known from the patent and scientific literature.

Therefore, it is respectfully requested that this rejection be withdrawn.

It is submitted that the claims are in condition for allowance.

If any fees are due they may be charged to deposit account 12-0425.

Questions regarding this response may be directed to the undersigned.

Respectfully submitted,

JANET I. CORD

strawberries

spring fruits

its summer fruits

The 600 strawberry varieties found today stem from five or six original wild species and are a member of the rose fami Sample different varieties at your local farmers market. You'll be surprised how different they are in shape, color and taste. Typically, the larger the berry, the more water it contains, the smaller the berry, the greater the intensity of flav For the most local of treats, nothing beats the flavor of strawberries picked fresh from your garden.

#### Albion

Albions have darker fruit color, both internally and externally, and a consistently sweeter flavor than most strawberries

## Alpine Strawberry

Alpine Strawberry (fraises des bois) is the tiny and exquisitely sweet wild strawberry of France. These little jewels aren much larger than a small fingernall, but are gigantic on flavor.

#### Aroma

Aromas have large, firm fruit has great flavor, with good color and a bright sheen.

## Camino Real

Camino Real has firm, dark red fruit with a long shelf life and good flavor.

## Diamante

Diamante is a large, flavorful, firm fruit with a bright red sheen.

## Earliglow

Earliglow are early producing, medium-sized strawberries with fantastic flavor. They are considered the best flavored o all the widely grown commercial varieties.

## Everbearer

Everbearer are large and bright scarlet red, have firm flesh, plenty of juice, and a delightful sweet flavor.

### Fragaria virginiana

Fragaria virginiana (wild strawberry) are small juicy, delicious red strawberries that are much richer in flavor than the commercial varieties found in stores today.

## Garden Strawberry

Garden Strawberry is the most common U.S. variety. It is a large, hardy berry that has a recognized traditional strawberry flavor.

## Strawberry Varieties

From Albions to Ventanas From Vanessa Higgins

The 600 strawberry varieties found today stem from five or six original wild species and are a member of the rose family. Sample different varieties at your local farmers market. You'll be surprised how different they are in shape, color and taste. Typically, the larger the berry, the more water it contains, the smaller the berry, the greater the intensity of flavor. For the most local of treats, nothing beats the flavor of strawberries picked fresh from your garden.

## Seascape

Seascape is a superior strawberry that is large, sweet, and hardy with superb flavor.

## Sweet Charlie

Sweet Charlie is orange-red on the outside and orange streaked with white in the inside with a distinctly sweet flavor due to a high sugar-to-acid ratio.

### Ventana

Ventana has bright red fruit, slightly lighter in color, a good flavor, standard shape, and large size with excellent fruit quality.
